NMR structures of two designed proteins with high sequence identity but different fold and function.
NMR structures of two designed proteins with high sequence identity but different fold and function.

How protein sequence codes for 3D structure remains a fundamental question in biology. One approach to understanding the folding code is to design proteins with high sequence identity. We present NMR structures of two designed proteins with high sequence identity but different fold and function. This result has implications for understanding not only the folding code but also the evolution of new folds.
