Abstract	We have used a recombinant, biotinylated form of the mouse NK cell receptor Ly49A to map its ligand on living cells. The ligand was identified as a protein of approximately 100 kDa, which was recognized by a monoclonal antibody that recognizes the extracellular domain of Ly49A. This protein was shown to be a member of the immunoglobulin superfamily and was found to be expressed on the surface of living cells. The protein was identified as a member of the immunoglobulin superfamily and was found to be expressed on the surface of living cells.
